Introduction

In this report we describe some six programs written for calculating point-wise cross-sections in the resolved and unresolved resonance region. These programs have been written specifically to read in the resonance parameters in the ENDF/B files. However, the smooth cross-sections from File 3 have to be added to the output of these programs to obtain the final cross-section.

Out of the six codes described in this report, the first four calculate the cross-sections in the resolved resonance region and the last two in the unresolved resonance region. The first program SIGPLOT calculates cross-sections for scattering, capture and fission using the single level Breit-Wigner parameters of ENDF/B Version I data. It also calculates multilevel scattering cross-sections. The cross-sections may be Doppler broadened if necessary. The second program SIGMA2 is essentially a modified version of SIGPLOT written for ENDF/B Version II data. The third program RAMP1 calculates scattering, capture and fission cross-sections using the Reich-Moore approximation, with or without Doppler broadening. The next program ADLER calculates cross-sections from the Adler-Adler parameters. Doppler broadening is done using the ψ and χ functions. AVRAGE3 and AVRAGE4 calculate cross-sections in the unresolved region using energy independent parameters and energy dependent parameters of ENDF/B Version II respectively. Width-fluctuation corrections are applied by numerical integration. Also, there is no provision made for allowing any inelastic effects in AVRAGE3 whereas they are taken into account in the latter program. After describing the programs, we have given the program listings with sample input data and

results of the test problems.

The main purpose of writing these codes has been to have a set of codes which (i) would serve as a standard reference set against which the results of other codes could be compared and (ii) could be used in neutron cross-sections evaluation and (iii) from which automated plots of cross-sections could be obtained for author proofs. As such, every effort has been made to obtain accurate results from the codes avoiding the usual computer time-saving approximations such as taking only a small number of resonances in a particular energy region. Also, these codes have been checked against existing codes to trace down any errors of programming. However, the author would appreciate it if the users could communicate any errors they might find in using these codes.

My grateful thanks are due to D. E. Cullen for writing the subroutines used in calculating the Doppler broadened cross sections by the trapezoidal rule I have also benefited from useful discussions with M. S. Moore.

Copies of these programs have been sent to the Argonne Code Center. (See Availability of Computer Codes)

Any further details regarding these programs may be obtained from the author at the National Neutron Cross Section Center.

Description of the Programs

PROGRAM SIGPLOT

This is a program to calculate scattering, capture, fission, and total cross sections from resonance parameters of Version I data from File 2 of ENDF/B. Provision is also made to allow for level-level interference effects in the scattering cross section. The formulae used are essentially the same as given in the report of Gregson, et al.,[1] but are modified to include fission. Modified versions of the three subroutines, ORDER, FACTS, and SIGMA, described in this report are used in the current program. Further details of thes formulae are given in the Data Formats and Procedures Manual[2].

Formulae:

1. Elastic Scattering

$$\sigma_{nn}^{\ell}(m) = (2\ell+1)\frac{4\pi}{k_m^2}\sin^2\varphi_\ell + \frac{\pi}{k_m^2}\sum_J g_J \sum_{r=1}^{N_{res}^{(\ell,J)}} \frac{\Gamma_{nr}^2\cos 2\varphi - 2\Gamma_{nr}(\Gamma_{\gamma r}+\Gamma_{fr})\sin^2\varphi_\ell}{(E-E_r')^2 + \left(\frac{\Gamma_r}{2}\right)^2} + \frac{2(E-E_r')\Gamma_{nr}\sin 2\varphi_\ell}{(E-E_r')^2 + \left(\frac{\Gamma_r}{2}\right)^2} \quad (1)$$

2. Capture

$$\sigma_{n\gamma}^{\ell}(m) = \frac{\pi}{k_m^2} \sum_J g_J \sum_{r=1}^{N_{res}^{(\ell,J)}} \frac{\Gamma_{nr}\Gamma_{\gamma r}}{(E-E_r')^2 + \left(\frac{\Gamma_r}{2}\right)^2} \quad . \tag{2}$$

3. Fission

$$\sigma_{nf}^{\ell}(m) = \frac{\pi}{k_m^2} \sum_J g_J \sum_{r=1}^{N_{res}^{(\ell,J)}} \frac{\Gamma_{nr}\Gamma_{fr}}{(E-E_r')^2 + \left(\frac{\Gamma_r}{2}\right)^2} \quad . \tag{3}$$

4. Elastic Scattering with Level-Level Interference

In addition to the expression given in Eq. (1), we have the following level-level interference term:

$$\frac{\pi}{k_m^2} \sum_J g_J \sum_{r=2}^{N_{res}^{(\ell,J)}} \sum_{s=1}^{r-1} \frac{2\Gamma_{nr}\Gamma_{ns}\left[(E-E_r')(E-E_s') + \frac{\Gamma_r\Gamma_s}{4}\right]}{\left[(E-E_r')^2 + \left(\frac{\Gamma_r}{2}\right)^2\right]\left[(E-E_s')^2 + \left(\frac{\Gamma_s}{2}\right)^2\right]} , \tag{4}$$

where m is the m^{th} isotope,

$N_{res}(\ell,J)$ are the number of resonances for a given ℓ and J,

$$\Gamma_{nr}(E) = \frac{P_\ell(E)\Gamma_{nr}(|E_r|)}{P_\ell(|E_r|)},$$

$$\Gamma_r = \Gamma_{nr}(E) + \Gamma_{\gamma r} + \Gamma_{fr},$$

$$E_r' = E_r + \left[\frac{S_\ell(|E_r|)-S_\ell(E)}{2P_\ell(|E_r|)}\right]\Gamma_{nr}(|E_r|) \qquad (E \text{ in eV}),$$

$$k_m = 2.196771\times10^{-3}\left(\frac{AWR}{AWR+1.0}\right)\sqrt{E(eV)} \qquad (\text{barns})^{-1/2},$$

AWR = mass of the element in units of the neutron mass,

E = neutron energy in eV in the Laboratory System,

S_ℓ = shift factor,

P_ℓ = penetration factor,

φ_ℓ = phase shift,

ρ = ka,

a = channel radius.

Storage Capacity of the Program

1. Maximum number of isotopes: 10.
2. Maximum number of ℓ values per isotope per energy range: 5.
3. Maximum number of resonances over all isotope energy ranges and ℓ values: 500.
4. Total memory for the program: 37K octal.

5. Time: approximately 14 secs C.P. time/ 25 res/ isotope on the CDC-6600.

6. This program assumes that the resolved resonance parameters are given for one energy range which is the same for all isotopes.

Procedure:

1. After all the data for one element are read in, the resonance energies over all isotopes are arranged in increasing order.

2. For each pair of levels which lie within the limits of the energy range in the input data, a variable number (8 = 4 MM as it stands now) of energy points which lie between these two levels are generated, and the scattering, capture, fission, and total cross section are calculated and printed out for all the resonances of a given isotope as well as for all the isotopes of a given element. A finer mesh may be obtained by setting MM (card SIGP246) to a higher value.

3. To avoid having huge core storage, the cross sections are not stored in memory but are printed out as they are generated.

4. The resonances in each isotope are arranged in increasing order of ℓ and for a given increasing order of J before the cross sections are calculated.

5. For a given isotope, the measured resonance spins are, for example, 3 and 4. In File 2 the spins of some low energy resonances where they have been experimentally measured will have one of these two values. For the rest of the resonances where this data is lacking, the

spins would be given as 3.5. In such a case, in calculating the cross section with level-level interference, we let spin-3 resonances interfere with one another. Similarly, spin-4 resonances that interfere with each other are treated as a group. The rest of the resonances (spin 3.5) do not interfere among themselves unless this is indicated on the title card in Col. 65 (see p. 8).

6. To Doppler-broaden cross sections, we write the Doppler-broadened cross section as

$$\sigma_{\Delta}(E') = \frac{1}{\Delta\sqrt{\pi}} \int_{0}^{\infty} \sigma(E'') \; e^{-[(E'-E'')/\Delta]^2} \; dE'' \; , \qquad (5)$$

where

$$\Delta\,(\text{eV}) = 0.3177 \left(\frac{T^{o}_{eff}}{293.0}\right)^{1/2} \left(\frac{E'(\text{eV})}{\text{AWR}}\right)^{1/2}$$

T^{o}_{eff} = effective temperature in degrees Kelvin.

AWR = nuclear mass

The above expression is obtained as a good approximation for the more accurate expression for Doppler-broadened cross section (see Solbrig[3]) when $E/\Delta \gg 1$. It is known that this approximation is good except at very low energies where the more accurate expression has to be used. Therefore, in this program Doppler-broadening of the cross section is by-passed for neutron energies less than 0.025 eV. The above expression

can be written as

$$\sigma_{\Delta}(E') = \frac{1}{\sqrt{\pi}} \int_{-E'/\Delta}^{\infty} \sigma(E' + x \cdot \Delta) e^{-x^2} dx , \tag{6}$$

where since E'/Δ is large, the integral is written as

$$\sigma_{\Delta}(E') = \frac{1}{\sqrt{\pi}} \int_{-\infty}^{+\infty} \sigma(E' + x \cdot \Delta) e^{-x^2} dx . \tag{7}$$

A. Gauss-Hermite Quadrature

This integral can be evaluated using a 9-point Gauss-Hermite quadrature formula, provided the structure in the cross section is not small compared with the Doppler width Δ. Comparison of a test case which is Doppler broadened using ψ and χ functions, the trapezoidal rule, and Gauss-Hermite quadrature formula gives accurate results, provided the width of the resonances $\Gamma \geq 5\Delta$. If this condition is not satisfied, we have recourse to using the trapezoidal rule for evaluating the integral as described below. In most of the cases we use the quadrature formula for calculating the integral, as it has been found that the trapezoidal rule method requires a large amount of computer time. However, the trapezoidal method should be used if the resonances are very narrow and/or are very closely spaced. This may be done by setting all FLAG(I) = 1 in the subroutine SIEVE.

B. Trapezoidal Method

The above integrals can also be evaluated numerically by using the

trapezoidal rule. To start with, a certain number of pivot points (NTAB which is an odd integer) equal to, say, 11 are specified at each energy E' where we wish to evaluate the Doppler-broadened cross section. Pivot points are then specified at eleven energy values given by $E'' = E'$ and $E'' = E' \pm \Delta \ldots . E' \pm 5\Delta$. The cross section to be Doppler-broadened is explicitly evaluated at each pivot point at every iteration. The integral will give negligible contribution beyond this energy interval due to the $e^{-(E'-E'')^2/\Delta^2}$ factor. If, however, E' is very small so that the energy at one of the above pivot points is less than or equal to zero, we set $E'' = 10^{-3}$ eV as the lowest energy and set the energy of the pivot points at $E'' = 10^{-3} + \Delta \ldots ., 10^{-3} + 10\Delta$. In addition, we have to specify an ERRØR (say of the order of 10^{-4}). The above integral is then evaluated at these points, and if the relative value in each subinterval is less than ERRØR/(NTAB-1), the program assumes that the integral has converged in that interval; if not, at every iteration the number of steps is doubled until the integral converges. This method has been checked against results obtained by using ψ and χ functions in test cases and found to converge rapidly.

Use of these two numerical methods to evaluate the Doppler-broadened cross sections enables us to treat resonances due to higher ℓ-values where expressions for the Doppler-broadened cross sections in terms of the ψ and χ functions become very involved.

Input Data

The first card of the input is a TITLE card with the format (7A4,2X,I5,F5.1, 2I5, E10.4, I5). One can punch an appropriate title in Cols. 1-28. If Doppler-broadened cross sections are desired, punch 1 in Col. 35, or else punch 0. In Cols. 36-40 give the effective temperature T_{eff} in degrees Kelvin, and in Cols. 41-45 punch NTAB, which is eual to the odd number of pivot points for the integration for Doppler-broadening; NTAB > 13 seems highly unlikely. In Cols. 46-50 punch an integer between 1 and 6 which specifies the particular cross section to be Doppler-broadened. The following list indicates these:

1 - scattering cross section with no level-level interference

2 - capture cross section with no level-level interference

3 - fission cross section with no level-level interference

4 - sum of the above three

5 - scattering cross section with level-level interference

6 - sum of 5, 2, and 3.

In Cols. 51-60 punch ERROR, which has been described above. If level-level interference in the scattering cross sections among those resonances which are assigned an average spin is desired, punch 1 in Col. 65, or else punch 0. The rest of the data cards are from ENDF/B File 2 beginning with the HEAD Card and these give the resonance parameters. These are described in the Data Formats and Procedures Manual[2].

REACTOR CODE ABSTRACT

1. Name of Code: SIGPLØT.

2. Computer for which Code is designed: CDC-6600.

3. Nature of problem solved: This code calculates the scattering, capture, fission, and total cross sections from resolved resonance parameter data. Scattering cross sections may be calculated with or without level-level interference. Provision is also made to numerically Doppler-broaden any of the cross sections.

4. Method of solution: Multi-level Breit-Wigner formula. Details of formulae to be found in Gregson, et al.[1]

5. Restrictions on the complexity of the problem: This program can handle resonance data up to a maximum of 10 different isotopes with a total number of 500 resonances and an ℓ value not exceeding 5. It further assumes that the resolved resonance parameters are given for one energy range which is the same for all the isotopes of an element. The mesh points at which the cross sections are calculated can be varied. Since the calculated data are not stored, an increase in the number of mesh points does not conflict with any storage requirements.

6. Typical running time: Calculations of the cross sections of monoisotopic manganese from its resonance data with 27 resonances, with 20 mesh points between the positive energy resonance, takes 14 secs of central processor time on the CDC-6600.

7. Unusual features of the program:

   a) In calculating scattering cross sections with level-level interference, resonances are grouped according to their spins for the same ℓ value. Thus for s-wave resonances, for example, the spins are 3 and 4. It is possible that there are a number of resonances whose spins have not been measured, and these are

given an average spin of 3.5. The program normally calculates scattering cross sections with level-level interference among the spin-3 group and the spin-4 group. Contributions of the spin-3.5 resonances are calculated as a sum of single-level Breit-Wigner terms. If, however, it is desired to include the level-level interference terms among these resonances, this may be indicated on the control card.

b) The method of numerical integration used to Doppler-broaden cross sections is very general and is designed to take care of situations where the fine structure of the cross section is rapidly varying.

8. Related auxiliary programs: This program has been patterned after the MLBW program[1] with certain corrections and changes in the subroutines ORDER, FACTS, and SIGMA.

9. References: K. Gregson, M. F. James, and D. S. Norton, "MLBW - A Multi-level Breit-Wigner Computer Program," U.K. Atomic Energy Establishment Report AEEW-M517 (1965).

10. Machine requirements: This needs a 37k octal memory.

11. Programming language: FORTRAN IV.

12. Operating system or monitor: Brookhaven National Laboratory version of CDC Scope 2.0 operating system.

13. Other programming or operating information: None.

14. Name and establishment: M. R. Bhat and D. Cullen, National Neutron Cross Section Center, Brookhaven National Laboratory, Upton, N.Y.

15. Material available: Fortran deck with sample output.

16. Category:

PROGRAM SIGMA2

This program is a modified version of SIGPLOT described in the preceding pages. The modifications enable it to handle ENDF/B Version II data. These modifications are described in the Data Formats and Procedures Manual[2] in great detail and are briefly the following:

(1) provision is made to give the individual isotopic masses AWRI

(2) channel radius "a" (in units of 10^{-12} cm) and defined by

$$a = \left[1.23(AWRI * 1.008665)^{1/3} + 0.8\right] \times 10^{-1}$$

is used to calculate the penetrabilities P_ℓ (ka) and the shift factors S_ℓ(ka) whereas the effective scattering radius $\hat{a}$ is used to calculate $\varphi_\ell(k\hat{a})$, the phase shift.

For details regarding the input data, Doppler broadening and other details of the program please see the write-up on SIGPLOT (p. 12) as they are common to the two programs.

PROGRAM RAMP1

Program RAMP1 (Reich And Moore Program Version 1) calculates scattering, capture, fission and total cross sections in the resolved resonance region using the Reich-Moore formalism[4]. The resonance parameters are assumed to be in the ENDF/B Version-II data format[2]. The cross sections may also be Doppler broadened if so desired.

Formulae:

The cross section for a neutron reaction with the exit channel c is:

$$\sigma_{nc} = \pi \lambda\!\!\!^{-}_n^2 \sum_J g_J \left| \delta_{nc} - U^J_{nc} \right|^2 \qquad (1)$$

where $\lambda\!\!\!^{-}_n$ is the reduced neutron wave length; g_J is the statistical weight factor for resonances of spin J and U^J_{nc} is the collision matrix.

In the Reich-Moore approximation, the collision matrix is expressed in terms of a matrix (I-K), with dimensions (m+1)x(m+1) where m is the number of fission channels used in the cross section analysis; (m=2 in the ENDF/B format) and it is assumed that there is only one neutron channel (though there may be two channel spins for p-wave neutrons). Thus we define,

$$(I-K)_{cc'} = \delta_{cc'} - \frac{i}{2} \sum_\lambda \frac{\Gamma_{\lambda c}^{1/2} \Gamma_{\lambda c'}^{1/2}}{E_\lambda - E - \frac{i}{2}\Gamma_{\lambda\gamma}} \qquad (2)$$

where E_λ is the resonance energy and $\Gamma_{\lambda\gamma}$ the corresponding capture width of the λ-th resonance and $\Gamma_{\lambda c}$ and $\Gamma_{\lambda c'}$ are the partial widths corresonding to the channels c and c'. Here it is also further assumed that the shift factor Δ_λ is zero. The collision matrix U^J_{nc} can be expressed in terms

of the matrix defined in equation (2) as

$$U^J_{nc} = e^{-i(\varphi_n+\varphi_c)} \left[2(I-K)^{-1}_{nc} - \delta_{nc}\right] \tag{3}$$

where φ_n and φ_c are the hard-sphere phase-shifts. The different cross sections can now be written as

$$\begin{aligned}\sigma_{Total} &= \sum_J \sigma^J_{nT} = 2\pi \lambda^2_n \sum_J g_J \mathrm{Re}\,(1-U^J_{nn}) \\ &= 2\pi \lambda^2_n \sum_J g_J \left[(1-\cos 2\varphi^{\ell}_n) + 2\mathrm{Re}\ (e^{-2i\varphi^{\ell}_n} \rho_{nn}) \right]\end{aligned} \tag{4}$$

$$\begin{aligned}\sigma_{Fission} &= \sum_J \sigma^J_{nf} = \pi \lambda^2_n \sum_J g_J \left(\left| U^J_{nf_1} \right|^2 + \left| U^J_{nf_2} \right|^2 \right) \\ &= 4\pi \lambda^2_n \sum_J g_J \left(\left| \rho^J_{nf_1} \right|^2 + \left| \rho^J_{nf_2} \right|^2 \right)\end{aligned} \tag{5}$$

$$\begin{aligned}\sigma_{Scattering} &= \sum_J \sigma^J_{nn} = \pi \lambda^2_n \sum_J g_J \left| 1 - U^J_{nn} \right|^2 \\ &= \pi \lambda^2_n \sum_J g_J \left[2(1 - \cos 2\varphi^{\ell}_n) + 4\mathrm{Re}\left(e^{-2i\varphi^{\ell}_n} \rho^J_{nn}\right) \right. \\ &\qquad \left. - 4\mathrm{Re}\ (\rho^J_{nn}) + 4 \left| \rho^J_{nn} \right|^2 \right]\end{aligned} \tag{6}$$

$$\sigma_{capture} = 4\pi \lambda^2_n \sum_J g_J \sum_{a,b} (I-K)^{-1}_{na}\ (I-K)^{-1}_{nb}{}^{*} \mathrm{Re}\left[(I-K)_{ab} - \delta_{ab}\right] \tag{7}$$

where a,b = 1, 2, 3, and 1 = neutron channel and 2, 3 are fission channels.

The total, fission and capture cross-sections are obtained by direct calculation and the scattering cross-section is obtained by subtraction form these.

In the above expressions the matrix ρ_{nc} is defined as

$$\rho_{nc} = \delta_{nc} - (I - K)^{-1}_{nc}.$$

In addition we define the following:

$$\Gamma_{\lambda n}(E) = \frac{P_\ell(E)\ \Gamma_{\lambda n}(|E_\lambda|)}{P_\ell(|E_\lambda|)}$$

$$k_n = \frac{1}{\lambda_n} = 2.196771 \times 10^{-3} \left(\frac{AWRI}{AWRI+1.0}\right)\sqrt{E(eV)}$$

where AWRI is the isotopic mass of the I-th isotope in units of the neutron mass.

E = the neutron energy in eV in the laboratory system.

P_ℓ = penetration factor for angular momentum ℓ.

φ_ℓ = phase shift factor " " " ".

where,

$$\varphi_0 = k\hat{a}$$

$$\varphi_1 = k\hat{a} - \tan^{-1}(k\hat{a})$$

$$\varphi_2 = k\hat{a} - \tan^{-1}\left(\frac{3k\hat{a}}{3-k^2\hat{a}^2}\right) \quad \text{etc.}$$

$\hat{a}$ = effective scattering radius.

We use a channel radius $a = (1.23(AWRI * 1.008665)^{1/3} + 0.8) \times 10^{-1}$ in units of 10^{-12} cm to calculate the penetration factor and the effective scattering radius "$\hat{a}$" as determined from a fit of experimental data to calculate the scattering cross section.

Storage Capacity of the Program

1. Maximum number of isotopes: 10.

2. Maximum number of ℓ values per isotope per energy range: 5.

3. Maximum number of resonances over all isotope energy ranges and ℓ values: 500.

4. Total memory for the program: 40 K octal.

5. Time: approximately 11 secs/100 energy points for a nucleus with 4 isotopes and 294 s- and p-wave resonances.

6. This program assumes that the resolved resonance parameters are given for one energy range which is the same for all isotopes.

Procedure:

1. After all the data for one element are read in, the resonance energies over all isotopes are arranged in increasing order.

2. For each pair of levels which lie within the limits of the energy range in the input data, a variable number of energy points (4 MM = 8 as it stands now) which lie between these two levels are generated, and the scattering, capture, fission, and total cross section are calculated and printed out for all the resonances of a given isotope as well as for all the isotopes of a given element. One can get a finer mesh by setting MM (card RMP1228) to a higher value.

3. To avoid having huge core storage, the cross sections are not stored in memory but are printed out as they are generated.

4. The resonances in each isotope are arranged in increasing order of ℓ and for a given increasing order of J before the cross sections are calculated.

5. To Doppler-broaden cross sections, the same procedure using Grauss-Hermite Quadrature or the Trapezoidal Method as described in SIGPLOT (p.10) is used.

Input Data

The first card of the input is a TITLE card with the format (7A4,2X,I5,F.1, 2I5, E10.4, I5). One can punch an appropriate title in Cols. 1-28. If Doppler-broadened cross sections are desired, punch 1 in Col. 35, or else punch 0. In Cols. 36-40 give the effective temperature T_{eff} in degrees Kelvin, and in Cols. 41-45 punch NTAB, which is equal to the odd number of pivot points for the integration for Doppler- broadening; NTAB > 13 seems highly unlikely. In Cols. 46-50 punch an integer between 1 and 4 which specifies the particular cross section to be Doppler-broadened. The following list indicates these:

1 - scattering cross section

2 - capture cross section

3 - fission cross section

4 - total cross section.

In Cols. 51-60 punch ERROR, which has been described above. The rest of the data cards are from ENDF/B File 2 beginning with the HEAD Card and these give the resonance parameters[2].

REACTOR CODE ABSTRACT

1. Name of Code: RAMP1

16. Category:

PROGRAM ADLER

This is a program to calculate total, capture or fission cross-sections according to the Adler-Adler formalism using the corresponding parameters from File 2 of ENDF/B Version II data.

Formulae

The Adler-Adler formulae have been discussed in the reports given in the references[5,6]. The formulae are:

$$\sigma^{(x)}(E) = \frac{2C}{E}(1 - \cos\omega) + \frac{C}{\sqrt{E}}\sum_k \frac{\nu_k(G_k^{(x)}\cos\omega + H_k^{(x)}\sin\omega) + (\mu_k - E)(H_k^{(x)}\cos\omega - G_k^{(x)}\sin\omega)}{(\mu_k - E)^2 + \nu_k^2}$$

$$+ \frac{C}{\sqrt{E}}\left(A_1^{(x)} + \frac{A_2^{(x)}}{E} + \frac{A_3^{(x)}}{E^2} + \frac{A_4^{(x)}}{E^3} + B_1^{(x)}E + B_2^{(x)}E^2\right) \qquad (1)$$

and $B.G = \frac{C}{\sqrt{E}}\left(A_1^{(x)} + \frac{A_2^{(x)}}{E} + \frac{A_3^{(x)}}{E^2} + \frac{A_4^{(x)}}{E^3} + B_1^{(x)}E + B_2^{(x)}E^2\right)$;

where $\frac{C}{E} = \pi\lambda^2$; where $\frac{1}{\lambda} = k = 2.196771 \times 10^{-3} \times \left(\frac{AWRI}{AWRI+1.0}\right)\sqrt{E(eV)}$.

where k is the wave number of the incident neutron in the center-of-mass system and AWRI is the isotopic mass in units of the neutron mass.

$\frac{2C}{E}(1-\cos\omega)$ = potential scattering cross section; this term is non-zero only for scattering and total cross sections.

Procedure (con't)

(3) Cross-sections are not stored in memory so that an increase in mesh points does not conflict with any memory requirements.

(4) Only s-wave resonances are handled by the program.

(5) The Doppler broadened cross-section is written as:

$$\sigma_{\Delta}(E) = \frac{1}{\Delta\sqrt{\pi}} \int_{0}^{\infty} \sigma(E') e^{\frac{-(E-E')^2}{\Delta^2}} dE' \qquad (2)$$

where $\Delta(eV) = 0.3177 \left(\frac{T^{\circ}_{eff}}{293.0}\right)^{\frac{1}{2}} \left(\frac{E(eV)}{AWRI}\right)^{\frac{1}{2}}$

where T°_{eff} = effective temperature in degrees Kelvin

AWRI = mass of the isotope. This expression is quite good except for resonances of very small energies.[7] We use the real and imaginary parts of the complex probability integral which are proportional to the Ψ and Φ functions to obtain expressions for Doppler broadened cross-sections.

We define

$$U = \mathrm{Im}\left(\frac{i}{\pi} \int_{-\infty}^{+\infty} \frac{e^{-t^2}}{z-t}\, dt\right) \quad ; \quad V = \mathrm{Re}\left(\frac{i}{\pi} \int_{-\infty}^{+\infty} \frac{e^{-t^2}}{z-t}\, dt\right) \qquad (3)$$

where $z = \xi + i\eta$, ξ and η real. Further,

$$\Psi(s,\theta) = \tfrac{1}{2}\sqrt{\frac{\pi}{\theta}}\, U(\xi,\eta) = \frac{1}{(4\pi\theta)^{\frac{1}{2}}} \int_{-\infty}^{+\infty} \frac{e^{-(s-r)^2/4\theta}}{1+r^2} dr$$

$$\text{and } \Phi(s,\theta) = \tfrac{1}{2}\sqrt{\frac{\pi}{\theta}}\, V(\xi,\eta) = \frac{1}{(4\pi\theta)^{\frac{1}{2}}} \int_{-\infty}^{+\infty} \frac{e^{-(s-r)^2/4\theta}}{1+r^2}\, r\, dr$$

where $\eta = \frac{1}{2\sqrt{\theta}}$ and $\xi = s\eta$. If we further set $\xi = \frac{\mu - E}{\Delta}$ and $\eta = \frac{\nu}{\Delta}$,

$\rho = 2k\hat{a}$ Where $\hat{a}$ corresponds to the effective scattering radius in units of 10^{-12} cm;

$= 2WN\sqrt{E(eV)}$ and $WN = 2.196771\left(\frac{AWRI}{AWRI + 1.0}\right) \times 10^{-3} \times \hat{a}$,

$A_1^{(x)}$, $A_2^{(x)}$, $A_3^{(x)}$, $A_4^{(x)}$ and $B_1^{(x)}$, $B_2^{(x)}$ are background parameters which give contributions due to "tails" of resonances lying outside of the energy range under consideration. They are associated with the type of reaction "x".

$G_k^{(x)}$, $H_k^{(x)}$ Are Adler-Adler parameters, characteristic of the k-th resonance and the type of reaction indicated by "x".

Procedure

(1) After all the data for one element are read in, the resonance energies of all the isotopes are arranged in increasing order.

(2) For each pair of resonances which lie within the limits of the energy range in the input data, a variable number of energy points (20 = 4 MM as it stands now) which lie between these two resonances are generated, and the total, capture and fission cross sections are calculated and printed out. This is done for all the resonances in an element. A finer mesh may be obtained by setting MM (card ADLR278) to a higher value.

we obtain the Doppler broadened cross section as

$$\sigma_{\Delta}^{(x)}(E) = \frac{2C}{E}(1-\cos\omega) + \frac{C\sqrt{\pi}}{\Delta}\sum_{k}\frac{U_k^{(x)}}{E^{\frac{1}{2}}}\left(G_k^{(x)}\cos\omega + H_k^{(x)}\sin\omega\right)$$

$$+ \frac{C\sqrt{\pi}}{\Delta}\sum_{k}\frac{V_k^{(x)}}{E^{\frac{1}{2}}}\left(H_k^{(x)}\cos\omega - G_k^{(x)}\sin\omega\right) \qquad (4)$$

The potential scattering term (non-zero only for scattering and total cross-sections) and the background terms are not Doppler broadened, as they are slowly varying and not affected by Doppler broadening. The functions $U_k^{(x)}$ and $V_k^{(x)}$ are characteristic of the k-th resonance of the type of cross-section "x" , and its parameters are evaluated using a subroutine-PFCN[8].

Input Data

First Data Card: Format (7A4,2X, I5, F5.1)

Reads in TITLE(1), ... , TITLE(7), IDPL, TEFF

TITLE(1), ..., TITLE(7), = any suitable title for the program.

IDPL = 1 if Doppler broadened cross-sections are desired or else = 0

TEFF = Effective temperature of the sample in degrees kelvin.

Rest of the Data Cards: Follow the ENDF/B File 2 format for Adler-Adler parameters. This is described in detail in Reference 2.

REACTOR CODE ABSTRACT

1. Name of Code: ADLER

2. Computer for which code is designed: CDC-6600

3. Nature of problem solved: This code calculates total, capture and fission cross-sections from the corresponding Adler-Adler parameters in the ENDF/B File 2 and also Doppler broadens cross-sections.

4. Method of solution: Adler-Adler formalism. Details of formulae are to be found in the report given in references.

5. Restrictions on the complexity of the problem: This program can handle resonance data up to a maximum of 10 isotopes with a total number of 500 resonances. It further assumes that the resolved resonance parameters are given for one energy range which is the same for all the isotopes of an element. The mesh points at which the cross-sections are calculated can be varied. Since the calculated data are not stored, an increase in the number of mesh points does not conflict with any storage requirement.

6. Typical running time: Calculations of cross-sections of one isotope with 37 resonances and 20 mesh points between resonances takes:
   (a) without Doppler broadening, 21 secs
   (b) with Doppler broadening, 209 secs.

7. Unusual features of the program: None

8. Related auxiliary program: None

9. References: D. B. Adler and F. T. Adler, Analysis of Neutron Resonances in Fissile Elements: Programs CØDILLI, CURVEPLØT and SIGMA, Report COO-1546-3 (Sept. 1966), Dept. of Physics, University of Illinois, Urbana, Illinois.

10. Machine requirements: This needs a 37K octal memory.

11. Programming language: FORTRAN IV

12. Operating system or monitor: Brookhaven National Laboratory version of CDC Scope 3 operating system.

13. Other programming or operating information: None

14. Name and establishment: M. R. Bhat, National Neutron Cross-Section Center, Brookhaven National Laboratory, Upton, New York.

15. Material available: FORTRAN Deck with sample output.

16. Category:

PROGRAM AVRAGE3

This is a program to calculate scattering, capture, and fission cross sections in the unresolved resonance region from the energy independent parameters given in ENDF/B, File 2.

Method

The method follows the paper of Lane and Lynn[9] and we write the average scattering, fission, and capture cross section respectively as

$$\left\langle \sigma_{n,n} \right\rangle = \frac{K}{E} \sum_J \frac{g_J}{\langle D_J \rangle} \left[\left\langle \frac{\Gamma_n \Gamma_n}{\Gamma_n+\Gamma_f+\Gamma_\gamma} \right\rangle - 2\Gamma_n \sin^2 \varphi_\ell \right] + \sigma_p \quad (1)$$

$$\left\langle \sigma_{n,f} \right\rangle = \frac{K}{E} \sum_J \frac{g_J}{\langle D_J \rangle} \left\langle \frac{\Gamma_n \Gamma_f}{\Gamma_n+\Gamma_f+\Gamma_\gamma} \right\rangle , \quad (2)$$

and

$$\left\langle \sigma_{n,\gamma} \right\rangle = \frac{K}{E} \sum_J \frac{g_J}{\langle D_J \rangle} \left\langle \frac{\Gamma_n \Gamma_\gamma}{\Gamma_n+\Gamma_f+\Gamma_\gamma} \right\rangle , \quad (3)$$

where $K = (2\pi^2/k^2)E(ev)$, where $k = \frac{1}{\lambda} = 2.196771 \times 10^{-3} * \left(\frac{AWRI}{AWRI+1.0}\right)\sqrt{E}$ and

AWRI is the isotopic mass,

E = neutron energy in eV,

$g_J = \frac{(2J+1)}{2(2I+1)}$, where I is the target nucleus spin and J is the compound nucleus spin,

$\langle D_J \rangle$ = mean level spacing in eV for spin J resonances,

$\sigma_p = \sum_\ell \sigma_{p\ell}$ = potential scattering cross section,

$\sigma_{p\ell} = 4\pi(2\ell+1)\frac{\sin^2 \varphi_\ell}{k^2}$ where ℓ is the angular momentum and

$\varphi_0 = k\hat{a}$ where $\hat{a}$ is the scattering radius (A)

$\varphi_1 = k\hat{a} - \tan^{-1}(k\hat{a})$ and etc.

and the rest of the quantities are different partial widths in eV. The quantities in equation (1) refer to one particular ℓ-value. The brackets indicate averaging over the neutron and fission width fluctuations assumed to follow a χ^2 distribution of different degrees of freedom as given in the ENDF/B data. We would like to point here that the fluctuation correction factors $R_{n\ell,J}$, $R_{\gamma\ell,J}$, or $R_{f\ell,J}$ are not calculated separately as the fluctuation corrections are applied by direct averaging as indicated in equations 1-3. The summation is over the different spin states. The averaging is done by the method of Greebler and Hutchins[10] and corresponds to evaluating the double integrals on a 10x10 grid, and ν can vary from 1 to 4. The gamma width Γ_γ is assumed to follow a δ-function type of distribution corresponding to a large number degrees of freedom in the χ^2 distribution.

Incidentally, we note here that this program (1) takes into account only s- and p-wave contributions to the cross sections and (2) does not take into account inelastic scattering. This program uses the channel radius $a = (1.23 \times (AWRI \times 1.008668)^{1/3} + 0.8) \times 10^{-1}$ in units of 10^{-12} cm to calculate nuclear penetrabilities.

This program needs 21K octal memory for execution.

The data input is explained in great detail in the FORTRAN listing of the program and follows the ENDF/B format except for the first data card which is the title card.

Title Card Format (I10, 7A4, 2X, 3E10.4)

This reads in IRUN, RUN(1), ·····, RUN(7), E0, EN, ESTEP.

IRUN = Any run number. If this is zero the program exists, otherwise this card indicates the beginning of a new calculation and one can stack any number of these one behind another.

RUN(1), ..., RUN(7) = Any alphanumeric information.

EO = Beginning energy for calculations in eV.

EN = Ending energy for calculations in eV.

ESTEP = Step interval in eV for calculations in eV.

This information is needed only for non-fissile nuclei.

REACTOR CODE ABSTRACT

1. Name of Code: AVRAGE3

2. Computer for which Code is designed: CDC-6600

3. Nature of problem solved: This Code calculates average scattering, capture, and fission cross sections from s- and p-wave data of the unresolved parameters of File 2 of ENDF/B.

4. Method of calculation: Theory of average cross section due to Lane and Lynn.[9]

5. Restrictions on the complexity of the problem: This program calculates average cross sections up to 100 energy values in the unresolved region. It does not allow for inelastic scattering and calculates only s- and p-wave contributions. Maximum $\nu = 4$.

6. Typical running time: Test run calculating s- and p-wave contributions to average scattering, capture, and fission cross sections of Pu-239 at 16 energy points and s- and p-wave contributions to average scattering at capture cross section of U-238 at 100 energy points took 5 secs of central processor time on the CDC-6600.

7. Unusual feature of the program: This program can allow for different degrees of freedom for fission width distribution of resonances of different spins.

8. Related auxiliary programs: None.

9. References: A. M. Lane and J. E. Lynn, Proc. Phys. Soc. A70, 557 (1957).

16. Category:

PROGRAM AVRAGE4

This is a program to calculate scattering capture, and fission cross sections in the unresolved resonance region, with the ENDF/B Version II data for the unresolved parameters of File 2 which gives the average neutron, gamma and fission widths and widths for any competing inelastic processes as a function of energy.

Method

The method follows the paper of Lane and Lynn[9] and we write the average scattering, fission, and capture corss section respectively as

$$\langle\sigma_n\rangle = \frac{K}{E}\sum_J \frac{g_J}{\langle D_J\rangle}\left[\left\langle\frac{\Gamma_n\Gamma_n}{\Gamma_n+\Gamma_f+\Gamma_\gamma+\Gamma_x}\right\rangle - 2\,\Gamma_n \sin^2\varphi_\ell\right] + \sigma_p \qquad (1)$$

$$\langle\sigma_f\rangle = \frac{K}{E}\sum_J \frac{g_J}{\langle D_J\rangle}\left\langle\frac{\Gamma_n\Gamma_f}{\Gamma_n+\Gamma_f+\Gamma_\gamma+\Gamma_x}\right\rangle , \qquad (2)$$

and

$$\langle\sigma_\gamma\rangle = \frac{K}{E}\sum_J \frac{g_J}{\langle D_J\rangle}\left\langle\frac{\Gamma_n\Gamma_\gamma}{\Gamma_n+\Gamma_f+\Gamma_\gamma+\Gamma_x}\right\rangle , \qquad (3)$$

where $K = (2\pi^2/k^2)E(eV)$ where k is defined below,

E = neutron energy in eV,

$g_J = \frac{(2J+1)}{2(2I+1)}$, where I is the target nucleus spin and J is the compound nucleus spin,

$\langle D_J\rangle$ = mean level spacing in eV spin J resonances,

$\sigma_p = \sum\sigma_{p\ell}$ = potential scattering cross section.

$$\sigma_{p\ell} = 4\pi(2\ell+1)\frac{\sin^2\varphi_\ell}{k^2}$$ Where ℓ is the angular momentum and

$\varphi_0 = k\hat{a}$ where $\hat{a}$ is the scattering radius (A)

$\varphi_1 = k\hat{a} - \tan^{-1}(k\hat{a})$

$\varphi_2 = k\hat{a} - \tan^{-1}\left(\frac{3k\hat{a}}{3-k^2\hat{a}^2}\right)$ where

$$k = 2.196771 \times 10^{-3}\left(\frac{AWRI}{AWRI+1.0}\right)\sqrt{E(eV)}$$

and AWRI is the isotopic mass in units of neutron mass.

Γ_x = is a width in eV to allow for any competing inelastic processes, and the rest of the quantities are different partial widths in eV.

$\Gamma_n = \Gamma_n^\circ \sqrt{E}\, V_\ell \mu_{\ell,J}$ where Γ_n° is the reduced neutron width (GNO(I)), $\mu_{\ell,J}$ is the number of degrees of freedom in the neutron width distribution (AMUN), E the neutron energy and V_ℓ is the penetration factor defined as:

$$V_\ell = 1 \text{ for } \ell = 0$$

$$= \rho^2/(1+\rho^2) \text{ for } \ell = 1$$

$$= \rho^4/(9+3\rho^2+\rho^4) \text{ for } \ell = 2$$

where $\rho = ka$ where k is the wave-number of the neutron in the center-of-mass system (see above) and $a = (1.23(AWRI \times 1.008665)^{1/3} + 0.8) \times 0.1$ is the channel radius in units of 10^{-12}cm. The brackets indicate averaging over the neutron, fission , and any inelastic width fluctuations assumed to follow a χ^2 distribution of different degrees of freedom as given in the ENDF/B data. The summation is over the different spin states J. Hence, allowance is made for possible different degrees of freedom of the fission width distribution corresponding to different spin states. The averaging is done by a method similar to that of Greebler and Hutchins,[10] and corresponds to evaluating the double integrals on a 10 X 10 grid, and ν can vary from 1 to 4. The gamma width Γ_γ is assumed to follow a δ-function type of distribution corresponding to a large number of degrees of freedom in the χ^2 distribution.

Incidentally, we note here that this program (1) takes into account only s-, p-, and d-wave contributions to the cross sections and (2) does take into account inelastic scattering. The scattering radius A in the

unresolved resonance region of ENDF/B File 2 is used to calculate potential scattering while the nuclear radius a defined above is used to calculate nuclear penetrabilities as suggested in the new procedural modifications at the April 1970 CSEWG Meeting.

This program needs 58K (octal) memory for execution.

The data input is explained in great detail in the FORTRAN listing of the program and follows the ENDF/B format except for the first data card which is the title card.

Title Card Format (I10, 7A4)

Read in IRUN, RUN(1), ..., RUN(7)

IRUN = Any run number. If it is zero the program exits if non-zero it indicates the beginning of a new calculation. One can stack any number of these cases one behind the other.

RUN(1), ..., RUN(7) = Any alphanumeric in formation.

PROGRAM ADLER, CALCULATES CROSS-SECTIONS FROM ADLER-ADLER PARAMETERS WITH OPTION FOR DOPPLER BROADENING,

ENDF/B VERSION II DATA,

TITLE ADLER TEST, U-233 DATA,

OPTION TO DOPPLER BROADEN 0 EFFECTIVE TEMPERATURE(*K) 293,000

(Z,A) DESIGNATION OF THE ELEMENT 9,2233E+04 AT.WT/MASS OF NEUTRON 2,3104E+02 NO OF ISOTOPES 1

DATA FOR ISOTOPE NUMBER 1

(Z,A) DESIGNATION OF THE ISOTOPE 9,2233E+04 FRACTIONAL ABUNDANCE 1,0000E+00 NO OF ENERGY RANGES 1
LOWER LIMIT OF THE ENERGY RANGE(EV) 7,9000E-01 UPPER LIMIT(EV) 6,0000E+01 LRU= 1 LRF= 4
NUCLEAR SPIN 2,5000E+00 SCATTERING LENGTH 1,0092E+00 NO OF L-VALUES 1
MASS OF THIS ISOTOPE IN UNITS OF NEUTRON MASS 2,3104E+02
LI= 6 IF LI=5 TOTAL AND CAPTURE, LI=6 FISSION AND CAPTURE, AND LI=7 TOTAL CAPTURE AND FISSION CROSS-SECTIONS GIVEN
NX= 3 IF NX=2 TOTAL AND CAPTURE BCKGRND PARAMETERS GIVEN,IF NX=3 TOTAL,CAPTURE AND FISSION PARAMETERS GIVEN

BACKGROUND PARAMETERS FOR THE TOTAL CROSS-SECTION
A1= 0,000000E+00 A2= 0,000000E+00 A3= 0,000000E+00 A4= 0,000000E+00 B1= 0,000000E+00 B2= 0,000000E+00

BACKGROUND PARAMETERS FOR THE FISSION CROSS-SECTION
A1= 0,000000E+00 A2= 0,000000E+00 A3= 0,000000E+00 A4= 0,000000E+00 B1= 0,000000E+00 B2= 0,000000E+00

BACKGROUND PARAMETERS FOR THE CAPTURE CROSS-SECTION
A1= 0,000000E+00 A2= 0,000000E+00 A3= 0,000000E+00 A4= 0,000000E+00 B1= 0,000000E+00 B2= 0,000000E+00

ANGULAR MOMENTUM OF THE RESONANCES 0 NUMBER OF J-STATES 1

J-VALUE FOR THESE RESONANCES 2,50 NUMBER OF RESONANCES FOR THE ABOVE L-VALUE AND THIS J IS 73

ADLER-ADLER PARAMETERS FOR THIS ISOTOPE
